# Overview

ProPixelizer's documentation can be viewed at [<https://propixelizer.github.io/docs/>].

The ProPixelizer package includes a number of things to achieve perfect pixelisation in your game.

- A [ProPixelizerUberShader](#) which provides control over pixelisation, color grading, outlines, cel shading and more.
- A [ShaderGraph SubTarget](#) and examples if you want to create your own shaders.
- The [ProPixelizerCamera](#) MonoBehaviour for controlling ProPixelizer's pixelisation.
- Multiple [pixelization methods](#), ranging from fully pixelated to hybrid/ selectively-pixelated scenes.
- Easy methods to [Remove Pixel Creep](#) to create crisp looking 3D pixel art.
- Different types of [edges and outlines](#) to support a variety of different pixel art styles.
- Custom tools for creating your own [dither patterns and color palettes](#), and [stepped animations](#).

If you need help please do contact me for support:

- via email, [elliott.bentine@gmail.com](mailto:elliott.bentine@gmail.com)
- via discord DMs (username: [elliottb256](#))
- via the ProPixelizer server (click the icon in the nav bar to join).

I hope you enjoy using ProPixelizer, and I'm always very pleased to hear what you make with it!

Cheers!

Elliot
